

Master in Electronics, electrical energy, automation

Sciences in electrical engineering for smart Grids and Buildings (SGB)

Presentation

Electrical networks, storage and buildings have become major strategic issues for modern societies faced with the challenges of sustainable development and energy transition. They are currently undergoing profound technological and conceptual changes. All three converge through the intelligent electrical network (the "smart grid"), where buildings are an essential link via customers who have become both consumers and producers (activist consumers). They have been the subject of extensive research, development and investment, in Europe and throughout the world. The SGB Master offers 24 months of high-level technical training in these three areas. It will give students a strong systemic view of the electrical system, including the economic, environmental and societal aspects, combined with a strong capacity for technical analysis.

This M2 involves work-linked training under a vocational training contract. Students wishing to go on to doctoral studies may conduct a project in a laboratory instead of pursuing work-linked training in a company.

Information will be available in the next few weeks from the G-INP website: master-smartgrid-energy.grenoble-inp.fr

Registration and scholarships

Candidates for continuing education:

You are eligible for continuing education:

- if you are resuming your studies after two years of interruption,
- or if you followed a training course under the continuing education scheme in either of the past two years,
- or if you are an employee, job seeker, or self-employed worker.

If you do not have the diploma required for admission to the course, you can undertake a process of [validation of prior personal and professional experience \(VAPP\)](#).

Practicals informations :

- > **School** : Grenoble INP
- > **Duration** : 2 years
- > **Course type** : Initial and Continuing Education
- > **Location(s)** :
- > **Contacts** :
