

UE Heterocyclic chemistry

Niveau d'étude
Bac +5

ECTS
3 crédits

Composante
UFR de Chimie
et de biologie

Période de
l'année
Toute l'année

Diplômes intégrant cet élément

- Master Chimie

- > **Langue(s) d'enseignement:** Anglais
- > **Ouvert aux étudiants en échange:** Oui
- > **Code d'export Apogée:** YAX9CH36

Présentation

Description

It is recognized that a large number of bioactive compounds are cyclic molecules containing one or several heteroatoms (N, O, S, ...). In this course, the chemical properties of the most representative 6- and 5-membered rings and the major methods used for their synthesis will be reviewed. Especially, methods using organometallic chemistry will be discussed. Nomenclature rules will also be explained and exemplified.

Details:

- I. Introduction General presentation and definitions
- II. Nomenclature Rules
- III. Structures of Heterocycles Structure-reactivity relationships
- IV. Common Reaction Types in Aromatic Heterocyclic Chemistry Electrophilic substitution, Nucleophilic substitution, Organometallic Heterocyclic Chemistry
- V. General Strategies for Heterocycle Synthesis
- VI. Typical reactivity and Synthesis of 6-membered rings Pyridine, Benzopyridines, Diazines
- VII. Typical reactivity and Synthesis of 5-membered rings Pyrrole, Furan, Thiophene, Azoles and their Benzofused analogs

VIII. Reactivity of Purines A combination of the 6- and 5-membered rings reactivity

Heures d'enseignement

CM	CM	27h
TD	TD	3h

Pré-requis recommandés

Prerequisites:

Organic chemistry and Benzene chemistry (bachelor program, CHI501 and CHI601). Some basics in organometallic chemistry will be appreciated.

Période : Semestre 9

Compétences visées

Skills:

Knowledge of the typical reactivity and synthesis methods of the most representative rings using classical and modern heterocyclic chemistry.
