## Présentation

### Description

This course is an introductory course on numerical field computation using the finite difference and the finite element methods.

### Objectifs

#### Content:

- Finite difference method.
- Finite element method:
  - Strong and weak formulations.
  - Finite element analysis : domain discretization, local and global interpolation, numerical integration, assembly, resolution of linear system, etc.

## Heures d'enseignement

UE Introduction to numerical field computation - CM/TD	Cours magistral - Travaux dirigés	16h
UE Introduction to numerical field computation - TP	TP	12h

## Pré-requis recommandés

Familiarity with the following content of the course "Numerical Methods" :

- Approximation and interpolation.
- Numerical integration.
- Numerical linear algebra:
  - Fast linear solvers (direct and iterative).
  - Fast eigen-solvers.

## Syllabus

1. Meunier, G. (2010). *The finite element method for electromagnetic modeling*, John Wiley & Sons.
2. Jin, J. M. (2015). *The finite element method in electromagnetics*, John Wiley & Sons.

**Période :** Semestre 8

## Compétences visées

At the end of the course, the student should be able to:

- Generate and discretize simple 2D geometries.
- Generate and run a finite difference code, and analyze its results for a simple 2D elliptic equation.
- Generate and run a simple finite element code, and analyze results for a simple 2D elliptic equation.
