UE Advanced Machine Learning: Applications to Vision, Audio and Text

Niveau d'étude
Bac +5

ECTS
6 crédits

Crédits ECTS Echange
6.0

Composante
UFR IM2AG (informatique, mathématiques et mathématiques appliquées)

Période de l'année
Automne (sept. à dec./janv.)

- **Langue(s) d'enseignement:** Anglais
- **Ouvert aux étudiants en échange:** Oui
- **Crédits ECTS Echange:** 6.0
- **Code d'export Apogée:** GBX9MO74

Présentation

Description

The course is split into two parts. During the first part, a wide range of machine learning algorithms will be discussed. The second part will focus on deep learning, and presentations more applied to the three data modalities and their combinations. The following is a non-exhaustive list of topics discussed:

- Computing dot products in high dimension & Page Rank
- Matrix completion/factorization (Stochastic Gradient Descent, SVD)
- Monte-carlo, MCMC methods: Metropolis-Hastings and Gibbs Sampling
- Unsupervised classification: Partitionning, Hierarchical, Kernel and Spectral clustering
- Alignment and matching algorithms (local/global, pairwise/multiple), dynamic programming, Hungarian algorithm,…
- Introduction to Deep Learning concepts, including CNN, RNN, Metric learning
- Attention models: Self-attention, Transformers
- Auditory data: Representation, sound source localisation and separation.
- Natural language data: Representation, Seq2Seq, Word2Vec, Machine Translation, Pre-training strategies, Benchmarks and evaluation

- Visual data: image and video representation, recap of traditional features, state-of-the-art neural architectures for feature extraction
- Object detection and recognition, action recognition.
- Multimodal learning: audio-visual data representation, multimedia retrieval.
- Generative Adversarial Networks: Image-image translation, conditional generation
